

# **GoMerchant, LLC**

**Title: XML Gateway API Specification**

**PRODUCT: XML Gateway**

Version 3.1.0

## Document Control/Revisions

Document Modification	Version	Author/Editor	Date
Original Draft XML Gateway API with CIM	3.0.0	RJT	2/16/2009
Modified for formatting and clarity	3.0.1	MEB	2/17/2009
Added C#.NET sample code	3.0.2	MEB	2/20/2009
Added field transaction_center_id to supersede merchant field. Merchant field retained for legacy support.	3.0.3	MEB	2/24/2009
Added ACH support for batch upload in XML format, edit/delete CIM account.	3.0.4	MEB	3/17/2009
Updated ACH features to include proper reference to Debit/Credit and category text.	3.0.5	MEB	6/30/2009
Added ACH test account data	3.0.6	MEB	7/1/2009
Updated required fields for test account	3.0.7	MEB	7/7/2009
Added support for card validation and immediate void	3.0.8	MEB	7/9/2009
Added support for CIM_INSERT	3.0.9	RMB	7/23/2009
Updated QUERY operation documentation	3.1.0	RMB	12/22/2009

6.1.2.	Perl 5 Sample for E-commerce.....	46

# 1. Introduction

The purpose of this document is to outline the technology and processes that drive the XML Gateway API. The API provides an interface into the gateway transaction processing network via secure sockets. The end user, after reading this document, should have sufficient knowledge based on the documentation and working samples provided to successfully integrate their ecommerce application into the XML Gateway API.

## 1.1. *Scope*

This specification will walk the reader through the each type of transaction supported by the XML gateway. A detailed description of each acceptable input message will be documented along with each possible response. This document will not cover language specific integrations, although there will be sample code provided in section 6.

## 1.2. *Product Description*

The XML gateway API is a programming interface that resides on transaction servers which communicate directly to credit card processing networks. The programming interface requires that the merchant, or their web programming staff, be sufficiently knowledgeable in programming skills in any programming or object oriented scripting language.

The XML Gateway API accepts the card purchasers information, including credit card information, billing address, total charge amount and order id and produces an authorization or decline directly from the merchant bank. The XML Gateway API provides methods to perform the following operations: AUTH, SALE, SETTLE, CREDIT, VOID, RETAIL SALE, RETAIL AUTH, QUERY, REAUTH, RESALE, CIM\_AUTH, CIM\_SALE, ACH\_DEBIT, CIM\_ACH\_DEBIT, CIM\_ACH\_CREDIT, CIM\_EDIT, CIM\_DELETE, ACH\_CREDIT, ACH\_VOID and RETAIL\_ALONE\_CREDIT.

The information is passed via 128bit SSL https post in XML format. That post occurs in the background from the merchant's server. Thus the purchaser never leaves the merchant's website. The authorization information is returned in XML format with full error trapping and reporting to indicate the success or failure of the transaction.

URL for secure https post:

**<https://secure.gomerchant.com/secure/gateway/xmlgateway.aspx>**

Operational process:

1. The merchant's website produces the XML with all the required information depending on the operation type and performs an https (silent POST) to the gateway transaction servers.
2. The gateway's transaction servers determine the operation type and execute it.
3. Once the correct operation is carried out, the gateway assembles the response in XML.
4. The gateway's transactions servers send the XML response to the merchant's web or transaction servers indicating a success, failure or error.
5. The merchant parses the XML and notifies the customer or user of a successful request, failure or error.

### 1.3. *Intended Audience*

This document is written exclusively for the use of approved merchants of GoMerchant, LLC. It is intended to assist merchants with the task of integrating their ecommerce/retail solution with products offered or approved for integration with GoMerchant's secure gateway processing networks.

## 2. Definitions

### 2.1. *Operation Types*

Operation Type	Description
<a href="#">AUTH</a>	An AUTH operation is nothing more than a transaction that reserves the funds on a customer's credit card. The AUTH transaction must be accompanied by a SETTLE transaction in order for the merchant to receive funds.
<a href="#">SALE</a>	A SALE operation produces a transaction that authorizes and captures the funds of the customer's credit card.
<a href="#">ACH_DEBIT</a>	An ACH_DEBIT operation produces a transaction that debits a bank checking or savings account.
<a href="#">RETAIL_AUTH</a>	A RETAIL_AUTH operation is nothing more than a transaction that reserves the funds on a customer's credit card. The RETAIL_AUTH transaction must be accompanied by a SETTLE transaction in order for the merchant to receive funds. Retail transactions require a retail merchant account.
<a href="#">RETAIL_SALE</a>	A RETAIL_SALE operation produces a transaction that authorizes and captures the funds of the customer's credit card. Retail transactions require a retail merchant account.
<a href="#">REAUTH</a>	A REAUTH operation uses the reference number from a previously successful AUTH/SALE/RETAIL_AUTH/RETAIL_SALE/CIM_AUTH/CIM_SALE transaction and initiates a new authorization using the billing information associated with the reference number provided. A follow up SETTLE transaction is required in order for the merchant to receive the funds for this authorization.
<a href="#">RESALE</a>	A RESALE operation uses the reference number from a previously successful AUTH/SALE/RETAIL_AUTH/RETAIL_SALE/CIM_AUTH/CIM_SALE transaction and initiates a new authorization and capture using the billing information associated with the reference number provided.
<a href="#">CIM_AUTH</a>	A CIM_AUTH operation uses the cim reference number from a previously entered customer record and initiates a new authorization using the billing information associated with the customer record identified. A follow up SETTLE transaction is required in order for the merchant to receive the funds for this authorization.
<a href="#">CIM_SALE</a>	A CIM_SALE operation uses the cim reference number from a previously entered customer record and initiates a new authorization and capture using the billing information associated with the customer record identified.
<a href="#">CIM_ACH_DEBIT</a>	A CIM_ACH_DEBIT operation uses the cim reference number from a previously entered customer record and initiates a new ach debit using the billing information associated with the customer record identified.
<a href="#">CIM_ACH_CREDIT</a>	A CIM_ACH_CREDIT operation uses the cim reference number from a previously entered customer record and initiates a new ach credit using the billing information associated with the customer record identified.
CIM_INSERT	A CIM_INSERT operation allows a customer to be inserted into the CIM

	without first charging a customer.
<a href="#">CIM_EDIT</a>	A CIM_EDIT operation allows access to a CIM stored record by cim_reference_number. Any of the account data stored with the CIM record can be modified such as card expiration.
<a href="#">CIM_DELETE</a>	A CIM_DELETE operation will completely remove the associated CIM record from the system based on the cim_reference_number supplied.
<a href="#">CREDIT</a>	CREDIT operations are performed against settled authorizations or sale transactions. Credits may only be performed against settled transactions and may not exceed the settled amount regardless of the original authorized amount. Multiple credits may be performed against a single settled authorization/sale up to the total settled amount.
<a href="#">ACH_CREDIT</a>	ACH_CREDIT operations move money into a checking or savings account.
<a href="#">RETAIL_ALONE_CREDIT</a>	A RETAIL_ALONE_CREDIT operation is a credit performed on new transactions that has never been processed through the gateway. This operation is different from a regular CREDIT, it does not issue credits against previously run transactions.
<a href="#">VOID</a>	VOID operations are performed against AUTH/RETAIL_AUTH/CIM_AUTH transactions that have not settled. Voids will prevent the authorized transaction from ever settling.
<a href="#">ACH_VOID</a>	ACH_VOID operations are performed against ACH transactions that have not posted. Voids will prevent the pending transaction from ever posting.
<a href="#">SETTLE</a>	A SETTLE operation allows the merchant to submit the reference number of a corresponding AUTH/RETAIL_AUTH/CIM_AUTH/REAUTH transaction for batch settlement. The settlement occurs between 2:00 AM and 6:0 AM EST each day.
<a href="#">QUERY</a>	QUERY operations allow the merchant to query the transaction database for all transaction types over a specified query range. The transaction data is returned with reference numbers in order for further operations to be performed against each transaction. NOTE – the full card number will not be exposed in a query transaction as per Visa/Mastercard requirements.

## 2.2. XML Parameters/Field Definitions

Field Name	Field Type	Field Length	Description
<b>Transaction Header Section</b>			
merchant	Int	9	Unique identifier assigned by gateway. This is your unique Transaction Center number, not your 16 digit Merchant ID. <b>This field is no longer required and exists for legacy support only.</b>
transaction_center_id	Int	9	Unique identifier assigned by gateway. This is your unique Transaction Center number.
gateway_id	String	Uniqueidentifier	Unique identifier assigned by gateway. Can be found and or reset via the Options Tab in the Transaction Center.
operation_type	String	Varchar(20)	String specifying operation

			attempting to be run. Must be one of the supported operation types: AUTH, SALE, ACH_DEBIT, ACH_CREDIT, RETAIL_AUTH, RETAIL_SALE, CIM_AUTH, CIM_SALE, CIM_EDIT, CIM_DELETE, CIM_ACH_DEBIT, CIM_ACH_CREDIT, REAUTH, RESALE, CREDIT, RETAIL_ALONE_CREDIT, VOID, SETTLE, QUERY
<b>Transaction Details Section</b>			
<b>order_id</b>	String	Varchar(50)	Unique order id or invoice number. Cannot contain "insert", "update" or "delete".
<b>total</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$) or commas allowed.
<b>Credit Card Data Section</b>			
<b>card_name</b>	String	Varchar(30)	Type of card. Visa, mastercard, amex, discover etc. "no" or "yes" can also be used. If "no" or "yes" is used then the system will attempt to determine the card_name based on the card_number passed in.
<b>card_number</b>	Numeric	(19,0)	Credit card account number
<b>card_exp</b>	Numeric	(4,0)	Credit card expiration date. MMY format.
<b>cvv2</b>	Numeric	(4,0)	Credit card security code, cvv2, cvc, cid
<b>mag_data</b>	String	Varchar (250)	Magnetic data containing at least the card number and card expiration. Obtained by swiping the credit card through a card swipe or VPOS unit.
<b>cc_validate</b>	Boolean	Bit	Set the value to 1 for doing small pre authorizations to determine a valid card, AVS or CVV2. The Transaction will be immediately voided. The field is NOT required for any other authorizations.
<b>ACH Data Section</b>			
<b>aba</b>	Numeric	(9, 0)	
<b>dda</b>	Numeric	(12, 0)	
<b>ach_account_type</b>	Char	(1)	C = Checking, S = Savings
<b>ach_category_text</b>	Varchar	(23)	The category setup in the virtual that corresponds to this transaction.
<b>close_date</b>	Varchar	(8)	The date the transaction is intended to post. Format: MM/DD/YY
<b>ach_name</b>	Varchar	(75)	Account nickname Ex: CitiBank Checking
<b>Cardholder/ACH owner Billing Address Section</b>			
<b>owner_name</b>	String	Varchar (75)	Card holders/ACH account name
<b>owner_street</b>	String	Varchar (250)	Billing street address

<b>owner_street2</b>	String	Varchar (250)	Billing street address 2
<b>owner_city</b>	String	Varchar (100)	Billing city
<b>owner_state</b>	String	Varchar (100)	Billing state
<b>owner_zip</b>	String	Varchar (20)	Billing zipcode
<b>owner_country</b>	String	Varchar (200)	Billing country
<b>owner_email</b>	String	Varchar (300)	Billing email address
<b>owner_phone</b>	String	Varchar (25)	Billing phone number
<b>Recurring Billing Section</b>			
<b>recurring</b>	Boolean	Bit	0 or 1 – indicates if transaction is a recurring transaction. When this flag is turned on (“1”), a valid recurring_type must also accompany the transaction.
<b>recurring_type</b>	String	Varchar(12)	Indicates the recurring interval for this transaction to repeat. Will be ignored if the recurring flag is not “1”. Accepted values: <b>daily, weekly, biweekly, monthly, quarterly, semiannually, annually</b>
<b>Customer IP Address Section</b>			
<b>remote_ip_address</b>	String	Varchar(16)	Ip address of the customer contacting the merchant’s site or application.
<b>Purchase Card Level II Data Section</b>			
<b>purchase_card</b>	Boolean	Bit	0 or 1 – indicates if the credit card used is a purchase card or not
<b>customer_reference_number</b>	String	Varchar(17)	Unique alpha-numeric value used to identify the card holder as a customer
<b>local_tax_flag</b>	Int	1	Flag set to 0, 1 or 2 that indicates the tax handling of the transaction being submitted.  <b>0 - tax not provided</b> <b>1 - tax included</b> <b>2 - non-taxable transaction</b>
<b>tax_amount</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$) or commas allowed.
<b>Additional Fields Section</b>			
<b>total_additional_fields</b>	Numeric	(4,0)	Indicates how many, if any, additional fields are associated with this transaction. This value specifies how many field_name/field_value pairs will be evaluated.  Additional fields can be created in the transaction center for use with direct card authorizations and XML gateway transactions. You have to create the fields in the transaction center before attempting to pass them in for a gateway transaction.

<b>field_name1..N</b>	String	Varchar(100)	The <field_name> must match exactly the field name you used when creating the field in the transaction center.
<b>field_value1..N</b>	String	Varchar(100)	Value for the field specified in the field_name tag with the same numeric identifier.
<b>Shipping Address Data Section</b>			
<b>shipping_name</b>	String	Varchar(100)	Ship to recipient name
<b>shipping_street</b>	String	Varchar(250)	Ship to street address
<b>shipping_street2</b>	String	Varchar(250)	Ship to street address 2
<b>shipping_city</b>	String	Varchar(100)	Ship to city
<b>shipping_state</b>	String	Varchar(100)	Ship to state
<b>shipping_zip</b>	String	Varchar(20)	Ship to zipcode
<b>shipping_country</b>	String	Varchar(200)	Ship to country
<b>shipping_phone</b>	String	Varchar(25)	Ship to phone number
<b>shipping_email</b>	String	Varchar(300)	Ship to contact email
<b>shipping_method</b>	String	Varchar(100)	Shipping method used
<b>Transaction Item Level III Data Section</b>			
<b>item_quantity1...1000</b>	Numeric	(4,0)	Quantity of item purchased for the N index.
<b>item_number1...1000</b>	String	Varchar(200)	Item identifier, SKU code etc
<b>item_description1...1000</b>	String	Varchar(1000)	Text description of item
<b>item_price1...1000</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$) or commas allowed.
<b>CIM Data Section</b>			
<b>cim_ref_num</b>	String	Varchar(75)	Unique alpha-numeric value used to identify the card holder as a customer. Can be used later for CIM specific operations.
<b>retail</b>	Boolean	Bit	0 or 1 indicating if the transaction should be submitted as a retail transaction.
<b>cim_card_type</b>	String	Varchar(30)	Card name such as Visa, Mastercard etc. This is used for CIM_AUTH/CIM_SALE operations and specifies which card to use in case the customer has multiple tied to their account.
<b>card_sequence</b>	Int	(2)	
<b>ach_sequence</b>	Int	(2)	
<b>ship_sequence</b>	Int	(2)	
<b>Credit/Settle Data Section</b>			
<b>total_number_transactions</b>	Numeric	(6,0)	Specifies the max N value for reference_number, credit_amount or settle_amount based on the operation type it is used with
<b>reference_number1...n</b>	Numeric	(12,0)	Unique transaction identifier returned by the gateway in the result of a previous transaction
<b>credit_amount1...n</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs

			(\$) or commas allowed.
<b>settle_amount1...n</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$ or commas allowed.
<b>Query Data Section</b>			
<b>card_type</b>	String	Varchar(30)	Type of card. Visa, mastercard, amex, discover etc. used in query
<b>trans_type</b>	String	Varchar(12)	Transaction type to search for. Accepted values" sale, auth, void, credit, settle
<b>trans_status</b>	Boolean	Bit	1 – successful transaction 0 – failed transaction
<b>begin_date</b>	String	Varchar(6)	MMDDYY format
<b>begin_time</b>	String	Varchar(6)	HHMMAM or HHMMPM
<b>end_date</b>	String	Varchar(6)	MMDDYY format
<b>end_time</b>	String	Varchar(6)	HHMMAM or HHMMPM
<b>low_amount</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$ or commas allowed.
<b>high_amount</b>	Numeric	(9,2)	Amount in US dollars. No dollar signs (\$ or commas allowed.
<b>Additional Authorization Details Section</b>			
<b>retail</b>			
<b>reference_number</b>			

### 3. API Specifications

#### 3.1. Requirements for XMLGateway Utilization

1. Processing Platforms Supported.
  - a. FDR (Omaha Platform)
  - b. Elavon (Formerly Nova)
  - c. Paymentech (Tampa Host Capture Platform)
  - d. TSYS (formerly Vital/VisaNet)
  - e. ACH (FirstFund)
2. Transaction Center ID
  - a. Numeric access key assigned by GoMerchant
  - b. Unique to merchant
  - c. Cannot be changed
  - d. Required for API integration
3. Gateway ID
  - a. Alpha-numeric passphrase assigned by GoMerchant
  - b. Can be changed via the gateway options area in the Transaction Center
  - c. Should be changed every 90 days to ensure security
  - d. Required for API integration
  - e. Retrieved from the options tab in the Transaction Center  
<https://secure.gomerchant.com/secure/transcenter/>
4. Secure URL  
<https://secure.gomerchant.com/secure/gateway/xmlgateway.aspx>
5. Development/Testing

- a. Test account is available
- b. Full test account information is documented in [section 5](#)

### 3.2. **Auth/Sale Credit Card Operations - ACH Debit Operations**

The AUTH/SALE Credit Card group of operations is the basic gateway function and the most commonly used function. These operation types are responsible for processing authorization only and sales on a customer’s credit card.

Successful AUTH/SALE transactions will contain a reference\_number in the generated response. This reference\_number can be used to call upon this transaction in future operations such as SETTLE or REAUTH.

Several variations of the AUTH/SALE operation type are available to be used. Each variation offers different features. Refer to their definitions below to decide which are most suitable for the integration desired. In addition, all authorization features can be combined into one message for example: E-commerce Auth Only, with Level II Data, Recurring Billing “monthly”, Level III Data, Additional Fields and CIM.

ACH Debit Operations will process a check transaction using the Automated Clearing House function. When an ACH Debit is initiated, the routing number is verified and the transaction is accepted. The ACH is assumed to be valid. The check will process on the specified date that is sent in the close\_date field. All ACH transactions that are posted prior to 4pm Eastern time, will process that day and funds should be available the next morning.

ACH transactions may be done as a CIM transaction as well as and or in addition to a recurring billing transaction. All additional functions of credit card transactions, additional fields, recurring billing and Level III data are available for each transaction.

#### 3.2.1. **Auth/Sale Credit Card E-commerce**

Fields utilized to attempt an auth and capture (SALE operation\_type) for e-commerce.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	“auth” or “sale”	X
<b>Transaction Details Section</b>		
order_id	String	X
total	Money	X
<b>Credit Card Data Section</b>		
card_name	String	X
card_number	Numeric	X
card_exp	Numeric	X
cvv2	numeric	
<b>Card Holder Billing Address Section</b>		
owner_name	String	X
owner_street	String	X
owner_street2	String	
owner_city	String	X
owner_state	String	X

owner_zip	String	X
owner_country	String	X
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

### 3.2.1.1. XML for E-commerce Auth/Sale

#### E-commerce (Auth and Capture) transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">Sale </FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>
```

#### E-commerce Auth (Authorization only) transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">Auth</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
```

```

<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.2. Auth/Sale Credit Card Retail (Card Present)

Fields utilized to attempt an auth and capture (SALE operation\_type) for retail.

To validate a credit card for AVS/CVV2, add the key cc\_validate and set its value to 1. The cc\_validate function will authorize and then immediately void the charge.

**NOTE** – Retail Card Present “swiped” transactions never store Mag Data and CVV2/CVC/CID.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	“retail_auth” or “retail_sale”	X
<b>Transaction Details Section</b>		
order_id	String	X
total	Money	X
<b>Credit Card Data Section</b>		
card_number	Numeric	X – required for e-comm & retail keyed
mag_data	String	X – required for retail Card Present
card_exp	Numeric	X – required for e-comm & retail keyed
cvv2	Numeric	
cc_validate	Bit	Optional 1=validate and void.
<b>Card Holder Billing Address Section</b>		
owner_name	String	
owner_street	String	
owner_street2	String	
owner_city	String	
owner_state	String	
owner_zip	String	
owner_country	String	
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

```

<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">retail_auth</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2"> </FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.3. ACH Debit

Fields utilized to attempt an ACH Debit (ACH\_DEBIT operation\_type).

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"ach_debit"	X
<b>Transaction Details Section</b>		
order_id	String	X
total	Money	X
<b>ACH Data Section</b>		
aba	Numeric	X
dda	Numeric	X
ach_account_type	Char	X
ach_category_text	String	X
close_date	String	X
ach_name	String	X
<b>Account Owner Data Section</b>		
owner_name	String	X
owner_street	String	X
owner_street2	String	
owner_city	String	X
owner_state	String	X
owner_zip	String	X
owner_country	String	X
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

#### 3.2.3.1. XML for ACH Debit

**ACH (Sale) transaction**

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>

```

```

<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">ach_debit</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="aba">031200213</FIELD>
<FIELD KEY="dda">7596321546</FIELD>
<FIELD KEY="ach_account_type">C</FIELD>
<FIELD KEY="ach_category_text">Membership Fee</FIELD>
<FIELD KEY="close_date">06/23/09</FIELD>
<FIELD KEY="ach_name">Citibank </FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.4. Auth/Sale with Level II (B2B) Support

The Level II (B2B) Support Operation allows for additional fields to be submitted to process business to business card transactions. The merchant account must be setup to accept B2B transactions in order to use this operation type. The field types listed below will be included in a standard AUTH/SALE message.

Field Name	Field Value	Required
<b>Purchase Card Level II Data Section</b>		
<b>purchase_card</b>	1	X
<b>customer_reference_number</b>	String	X
<b>local_tax_flag</b>	Set group	X
<b>shipping_zip</b>	String	X
<b>tax_amount</b>	Money	X

#### 3.2.4.1. XML for Level II B2B transaction

```

<FIELD KEY="purchase_card">1</FIELD>
<FIELD KEY="customer_reference_number">1235493</FIELD>
<FIELD KEY="local_tax_flag">1</FIELD>
<FIELD KEY="shipping_zip">19036</FIELD>
<FIELD KEY="tax_amount">0.06</FIELD>

```

#### Example (Authorization Only) B2B e-commerce transaction

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>

```

```

<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">sale</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="purchase_card">1</FIELD>
<FIELD KEY="customer_reference_number">1235493</FIELD>
<FIELD KEY="local_tax_flag">1</FIELD>
<FIELD KEY="shipping_zip">19036</FIELD>
<FIELD KEY="tax_amount">0.06</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.5. Auth/Sale with Additional Fields Support

Operation allows for additional fields to be submitted as part of a regular AUTH/SALE request. The additional fields must be setup and configured beforehand via the Transaction Center GUI.

<total\_additional\_fields> must contain the total number of additional fields passed in. It is the **N** value for the <field\_name> and <field\_value> tags.

Field Name	Field Value	Required
<b>Additional Fields Section</b>		
<b>total_additional_fields</b>	Numeric	X
<b>field_name1...N</b>	String	X
<b>field_value1...N</b>	Set group	X

#### 3.2.5.1. XML for Additional Fields transaction

```

<FIELD KEY="total_additional_fields">3</FIELD>
<FIELD KEY="field_name1">color</FIELD>
<FIELD KEY="field_value1">red</FIELD>
<FIELD KEY="field_name2">size</FIELD>
<FIELD KEY="field_value2">medium</FIELD>
<FIELD KEY="field_name3">style</FIELD>

```

<FIELD KEY="field\_value3">long sleeve</FIELD>

**Example: Auth (Authorization Only) Additional Fields e-commerce transaction**

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">auth </FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
<FIELD KEY="total_additional_fields">3</FIELD>
<FIELD KEY="field_name1">color</FIELD>
<FIELD KEY="field_value1">red</FIELD>
<FIELD KEY="field_name2">size</FIELD>
<FIELD KEY="field_value2">medium</FIELD>
<FIELD KEY="field_name3">style</FIELD>
<FIELD KEY="field_value3">long sleeve</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.2.6. Auth/Sale Level III Data Support

Operation allows for all fields to be submitted that specify Level III data. Level III support must be enabled for the merchant account in order to use this operation type.

Level III data support is composed of two parts, item information and shipping information. One or both sets can be submitted with a Level III data support AUTH/SALE operation. Item information is limited to a maximum of 1000 line items per transaction.

**Important Note:** No calculations are performed on the line entry items. The item information is simply stored with the transaction. The amount specified in the <total> tag is what will be charged. Level III is not submitted to the processor for interchange compliance it is simply for reference.

Field Name	Field Value	Required
Transaction Item Level III Data Section		

item_quantity1...1000	Numeric	X
item_number1...1000	String	X
item_description1...1000	String	X
item_price1...1000	Money	X
<b>Shipping Address Data Section</b>		
shipping_name	String	X
shipping_street	String	
shipping_street2	String	
shipping_city	String	
shipping_state	String	
shipping_zip	String	
shipping_country	String	
shipping_phone	String	
shipping_email	String	
shipping_method	String	

### 3.2.6.1. XML Level III transaction

```

<FIELD KEY="item_quantity1">1</FIELD>
<FIELD KEY="item_price1">1.00</FIELD>
<FIELD KEY="item_number1">num 1</FIELD>
<FIELD KEY="item_description1">desc 1</FIELD>
<FIELD KEY="item_quantity2">2</FIELD>
<FIELD KEY="item_price2">2.00</FIELD>
<FIELD KEY="item_number2">num 2</FIELD>
<FIELD KEY="item_description2">desc 2</FIELD>
<FIELD KEY="item_quantityN">N</FIELD>
<FIELD KEY="item_priceN">N.NN</FIELD>
<FIELD KEY="item_numberN">num N</FIELD>
<FIELD KEY="item_descriptionN">desc N</FIELD>
<FIELD KEY="shipping_name">bob tester</FIELD>
<FIELD KEY="shipping_street">123 test rd</FIELD>
<FIELD KEY="shipping_street2"></FIELD>
<FIELD KEY="shipping_city">here</FIELD>
<FIELD KEY="shipping_state">NJ </FIELD>
<FIELD KEY="shipping_zip">92835</FIELD>
<FIELD KEY="shipping_country">US</FIELD>
<FIELD KEY="shipping_phone">999-999-9999</FIELD>
<FIELD KEY="shipping_email">levelIII@email.com</FIELD>
<FIELD KEY="shipping_method">UPS Ground</FIELD>

```

#### Example Auth (Authorization Only) Level III e-commerce transaction

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">sale </FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>

```

```

<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
<FIELD KEY="item_quantity1">1</FIELD>
<FIELD KEY="item_price1">1.00</FIELD>
<FIELD KEY="item_number1">num 1</FIELD>
<FIELD KEY="item_description1">desc 1</FIELD>
<FIELD KEY="item_quantity2">2</FIELD>
<FIELD KEY="item_price2">2.00</FIELD>
<FIELD KEY="item_number2">num 2</FIELD>
<FIELD KEY="item_description2">desc 2</FIELD>
<FIELD KEY="item_quantity3">3</FIELD>
<FIELD KEY="item_price3">3.00</FIELD>
<FIELD KEY="item_number3">num 3</FIELD>
<FIELD KEY="item_description3">desc 3</FIELD>
<FIELD KEY="shipping_zip">92835</FIELD>
<FIELD KEY="shipping_name">bob tester</FIELD>
<FIELD KEY="shipping_street">123 test rd</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.7. Auth/Sale/ACH Debit/Credit CIM (Customer Information Management) Support

CIM is short for Customer Information Management. CIM Operations allow additional fields to be submitted that specify a transaction to be stored permanently in the CIM database. When a transaction is submitted and stored in the CIM database, additional sales/authorizations may be submitted without the need for card holder/ach check data. CIM support must be enabled for the merchant account in order to use this operation type.

**NOTE** – Retail card present “swiped” transactions never store Mag Data and CVV2/CVC/CID. Only the card number and expiration will be retained for a future authorization performed against the CIM record.

A CIM can have 0 or more shipping addresses associated with their record. The merchant can pass in the specified shipping fields to create or update the specified shipping address for the customer record or they can be omitted to not create or update any shipping information for the customer tied to the <cim\_ref\_num>.

The CIM spec provides a method to send in a new transaction or perform a Credit Card Auth/Sale or and ACH Debit/Credit transaction against an existing record.

**Important Note:** The <cim\_ref\_num> should be unique to the customer being billed. If the number is not unique it will cause an update to occur for the customer tied to that <cim\_ref\_num> already. It is intended to work this way to enable customer updates to occur in one step when a new transaction is processed for their account.

**CIM Field Requirements for (New) Customer Transaction**

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
Operation_type	“auth”, “sale” or “ach_debit”, “ach_credit”	X
<b>Transaction Details Section</b>		
order_id	String	X
Total	Money	X
<b>CIM Details Section</b>		
cim_ref_num	String	X
<b>Shipping Address Section</b>		
shipping_name	String	
shipping_street	String	
shipping_street2	String	
shipping_city	String	
shipping_state	String	
shipping_zip	String	
shipping_country	String	
shipping_phone	String	
shipping_email	String	
shipping_method	String	
<b>Credit Card Data Section</b>		
card_name	String	X
card_number	Numeric	X – required for e-comm & retail keyed
mag_data	String	X – required for retail Card Present
card_exp	Numeric	X – required for e-comm & retail keyed
cvv2	Numeric	
<b>ACH Data Section</b>		
aba	Numeric	X- required for ACH
dda	Numeric	X- required for ACH
ach_account_type	Char	X- required for ACH
ach_category_text	String	X- required for ACH
close_date	String	X- required for ACH
ach_name	String	X- required for ACH
<b>Card Holder/ACH Owner Billing Address Section</b>		
owner_name	String	X
owner_street	String	X
owner_street2	String	
owner_city	String	X
owner_state	String	X
owner_zip	String	X

owner_country	String	X
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

#### CIM Field Requirements for (Existing) Customer Transaction

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
Gateway_id	Unique identifier	X
operation_type	“cim_auth”, “cim_sale” or “cim_ach_debit”, “cim_ach_credit”	X
<b>Transaction Details Section</b>		
order_id	String	X
Total	Money	X
<b>CIM Data Section</b>		
cim_ref_num	String	X – if no reference_number
Retail	Boolean	
cim_card_type	String	
card_sequence	Int	X – Required if multiple card types stored.
ach_sequence	Int	X – Required if multiple accounts stored.
ship_sequence	Int	X – Required if multiple shipping addresses stored.

### 3.2.7.1. XML E-commerce Auth/Sale CIM (New Customer) transaction

#### Example: Sale (Auth and Capture) CIM new customer e-commerce transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">auth</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
```

```

<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
<FIELD KEY="cim_ref_num">100231</FIELD>
<FIELD KEY="shipping_zip">92835</FIELD>
<FIELD KEY="shipping_name">bob tester</FIELD>
<FIELD KEY="shipping_street">123 test rd</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.7.2. XML E-commerce Auth/Sale CIM (Existing Customer) transaction

**Example: Sale (Auth and Capture) CIM existing customer e-commerce transaction**

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_sale</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="cim_ref_num">10015</FIELD>
<FIELD KEY="cim_card_type">visa</FIELD>
<FIELD KEY="card_sequence">1</FIELD>
<FIELD KEY="retail">0</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.7.3. XML Retail Auth/Sale CIM (Existing Customer) transaction

**Example: Sale (Auth and Capture) CIM existing customer retail transaction**

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_sale</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="cim_ref_num">10015</FIELD>
<FIELD KEY="cim_card_type">visa</FIELD>
<FIELD KEY="card_sequence">1</FIELD>
<FIELD KEY="retail">1</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.7.4. XML ACH Debit CIM (New Customer) transaction

#### Example: ACH Debit CIM new customer ACH transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_ach_debit</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="aba">031253032 </FIELD>
<FIELD KEY="dda">7869453216 </FIELD>
<FIELD KEY="ach_type">C </FIELD>
<FIELD KEY="ach_category_text">Membership Fee</FIELD>
<FIELD KEY="close_date">06/23/09</FIELD>
<FIELD KEY="ach_name">Citibank</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
<FIELD KEY="cim_ref_num">100231</FIELD>
<FIELD KEY="shipping_zip">92835</FIELD>
<FIELD KEY="shipping_name">bob tester</FIELD>
<FIELD KEY="shipping_street">123 test rd</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.2.7.5. XML ACH Debit CIM (Existing Customer) transaction

#### Example: ACH Debit CIM existing customer ACH transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_ach_debit </FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="cim_ref_num">10015</FIELD>
<FIELD KEY="ach_sequence">1</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.2.8. Auth/Sale Recurring Billing Support

The Recurring Billing option will attempt a sale or auth only transaction for e-commerce or retail and mark the transaction as a recurring payment. Recurring payment options are:

1. Daily
2. Weekly
3. Biweekly
4. Monthly
5. Quarterly
6. Semiannually
7. Annually

#### Recurring Billing Field Requirements.

Field Name	Field Value	Required
<b>Recurring Billing Data Section</b>		
<b>recurring</b>	1	X
<b>recurring_type</b>	daily, weekly, biweekly, monthly, quarterly, semiannually, annually	X

#### 3.2.8.1. XML E-commerce Auth/Sale Recurring Billing transaction

```
<FIELD KEY="recurring">1</FIELD>
<FIELD KEY="recurring_type">monthly</FIELD>
```

#### Example: Sale (Authorization Only) Recurring Billing e-commerce transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">auth</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="card_name">Visa</FIELD>
<FIELD KEY="card_number">4111111111111111</FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="cvv2">123</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
```

```

<FIELD KEY="recurring">1</FIELD>
<FIELD KEY="recurring_type">monthly</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.2.9. Re-Authorize/Re-Sale Operations

This will attempt to authorize and capture (RESALE operation type) the transaction entered based on a <reference\_number> of a previously authorized transaction without the need to re-input card data or ach check data.

#### Re-Authorize/Re-Sale Operations

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"reauth", "resale"	X
<b>Transaction Details Section</b>		
order_id	String	X
total	Money	X
<b>Additional Authorization Data Section</b>		
reference_number	Numeric	X – if no cim_ref_num
card_exp	Numeric	X
retail	Boolean	
<b>Recurring Billing Data Section</b>		
recurring	Boolean	
recurring_type	Set group	

#### 3.2.9.1. XML E-commerce ReAuth/ReSale existing transaction

##### Reference Number RESALE e-commerce transaction:

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">resale</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="reference_number">125095</FIELD>
</FIELDS>
</TRANSACTION>

```

##### Reference Number REAUTH (Authorize Only) e-commerce transaction:

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">reauth</FIELD>

```

```
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="reference_number">125095</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.2.10. Auth/Sale Responses

#### Response for Credit Card/ACH Transactions (Non-CIM)

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="status">0-error 1-success 2-declined</FIELD>
<FIELD KEY="auth_code">character code sent by the bank </FIELD>
<FIELD KEY="auth_response">message from the bank </FIELD>
<FIELD KEY="avs_code">avs code from the bank</FIELD>
<FIELD KEY="cvv2_code">cvv2 code from the bank</FIELD>
<FIELD KEY="order_id">echoed back from original post</FIELD>
<FIELD KEY="reference_number">returned for use with credits/voids/settles</FIELD>
<FIELD KEY="error">error text</FIELD>
</FIELDS>
</RESPONSE>
```

#### Response for Credit Card/ACH Transactions (CIM)

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="status">0-error 1-success 2-declined</FIELD>
<FIELD KEY="auth_code">character code sent by the bank </FIELD>
<FIELD KEY="auth_response">message from the bank </FIELD>
<FIELD KEY="avs_code">avs code from the bank</FIELD>
<FIELD KEY="cvv2_code">cvv2 code from the bank</FIELD>
<FIELD KEY="order_id">echoed back from original post</FIELD>
<FIELD KEY="reference_number">returned for use with credits/voids/settles</FIELD>
<FIELD KEY="error">error text</FIELD>
<FIELD KEY="card_sequence">echoed back sequence number of the card input</FIELD>
<FIELD KEY="ach_sequence">echoed back sequence number of the ach (check) input</FIELD>
<FIELD KEY="ship_sequence">echoed back sequence number of the shipping address input</FIELD>
</FIELDS>
</RESPONSE>
```

#### STATUS – 0 - response:

```
<FIELD KEY="status">0</FIELD>
<FIELD KEY="auth_code"></FIELD>
<FIELD KEY="auth_response"></FIELD>
<FIELD KEY="avs_code"></FIELD>
<FIELD KEY="cvv2_code"></FIELD>
<FIELD KEY="order_id">ECHO Order ID Passed in</FIELD>
<FIELD KEY="reference_number"></FIELD>
<FIELD KEY="error">DESCRIPTIVE ERROR MESSAGE</FIELD>
```

Notice most fields are blank when status = 0! If the status is a 1 or 2 then the fields will be filled in with the appropriate responses

**ERROR –**

As is commonplace in XML, fields with no values can be self closing, if no error is returned in the error field, then it will return as <FIELD KEY="error" />. Please note that some successful transactions will return the error field empty with the self closing syntax.

If status is 1 the response will look like this:  
 <FIELD KEY="status">1</FIELD>  
 <FIELD KEY="auth\_code">AB5943</FIELD>  
 <FIELD KEY="auth\_response">Approved</FIELD>  
 <FIELD KEY="avs\_code">Y</FIELD>  
 <FIELD KEY="cvv2\_code">U</FIELD>  
 <FIELD KEY="order\_id">Test Txn Oid</FIELD>  
 <FIELD KEY="reference\_number">1549843</FIELD>  
 <FIELD KEY="error" />

**reference\_number** – this is the number used in later operations to reference specific transactions for credits, voids and settles.

**3.3. Credit Operations**

CREDIT operations are performed against settled authorizations or sale transactions for Credit Cards. ACH transactions perform Credits to move money into a specified bank checking or savings account. Credit Card e-commerce and MO/TO account credits may only be performed against settled transactions and may not exceed the settled amount regardless of the original authorized amount. Multiple credits may be performed against a single settled authorization/sale. Retail Credit Card transactions may perform a credit with a matching authorization and settle record. ACH Credit transactions may be performed at any time to move money into an existing bank account such as for payroll direct deposit.

**3.3.1. E-commerce/MOTO/Retail (Card Present) Credit Existing Transaction**

The <total\_number\_transactions> field specifies the **N** number of <reference\_number> and <credit\_amount> tags to look for. The total\_number\_transactions field must match the number of transactions entered or the gateway will respond with an error.

Ex: total\_number\_transactions = 5 There must be reference\_numbers1..5 etc.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"credit"	X
<b>Credit/Settle Data Section</b>		
total_number_transactions	String	X
reference_number1...n	numeric	X
credit_amount1...n	Money	X
<b>Customer IP Address Section</b>		
remote_ip_address	String	

<?xml version="1.0" encoding="UTF-8"?>

```

<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">credit</FIELD>
<FIELD KEY="total_number_transactions">2</FIELD>
<FIELD KEY="reference_number1">1222</FIELD>
<FIELD KEY="reference_number2">33334</FIELD>
<FIELD KEY="credit_amount1">5.00</FIELD>
<FIELD KEY="credit_amount2">1.00</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.3.2. Retail (Card Present) Single Transaction Credit

The Retail Alone Credit operation allows the merchant to credit a transaction that has NOT been previously run through the gateway. This must be enabled on the merchant’s account before attempting.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	“retail_alone_credit”	X
<b>Transaction Details Section</b>		
order_id	String	X
Total	Money	X
<b>Credit Card Data Section</b>		
mag_data	String	X – Required for Card Present Swipe Transaction.
card_name	String	X – Required if mag data blank
card_number	Numeric	X – Required if mag data blank.
card_exp	Numeric	X – Required if mag data blank.
cvv2	Numeric	
<b>Card Holder Billing Address Section</b>		
owner_name	String	
owner_street	String	
owner_street2	String	
owner_city	String	
owner_state	String	
owner_zip	String	
owner_country	String	
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

Example: Retail Card Present (Single Credit) with Mag Data transaction

owner_street	String	X
owner_street2	String	
owner_city	String	X
owner_state	String	X
owner_zip	String	X
owner_country	String	X
owner_email	String	
owner_phone	String	
<b>Customer IP Address Section</b>		
remote_ip_address	String	

### 3.3.3.1. XML for ACH Credit

#### ACH (Sale) transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">ach_credit</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="total">1.00</FIELD>
<FIELD KEY="aba">031200213</FIELD>
<FIELD KEY="dda">7596321546</FIELD>
<FIELD KEY="ach_account_type">C</FIELD>
<FIELD KEY="ach_category_text">Membership Fee</FIELD>
<FIELD KEY="close_date">06/23/09</FIELD>
<FIELD KEY="ach_name">Citibank</FIELD>
<FIELD KEY="owner_name">Bob Tester</FIELD>
<FIELD KEY="owner_street">123 Test Rd.</FIELD>
<FIELD KEY="owner_street2"></FIELD>
<FIELD KEY="owner_city">Cityville</FIELD>
<FIELD KEY="owner_state">NJ</FIELD>
<FIELD KEY="owner_zip">08035</FIELD>
<FIELD KEY="owner_country">US</FIELD>
<FIELD KEY="owner_email"></FIELD>
<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.3.4. E-commerce/MOTO/Retail (Card Present) Credit Existing Transaction Response

#### Returned from XMLGateway for operation\_type credit:

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="total_transactions_credited">Total number of transactions credited</FIELD>
<FIELD KEY="status1..n"> 0-error 1-success 2-Rejected</FIELD>
<FIELD KEY="response1..n">Response text returned by Transaction Center</FIELD>
```

```
<FIELD KEY="reference_number1..n">reference number of credited transaction</FIELD>
<FIELD KEY="credit_amount1..n">amount credited</FIELD>
<FIELD KEY="error1..n">error text</FIELD>
</FIELDS>
</RESPONSE>
```

**\*\*NOTE\*\***

total\_transactions\_credited - the number of successful credits performed on the list of credits attempted. This value can be used to check the successful statuses of the returned credits and make sure the number of successful statuses is the same as the total\_transactions\_credited.

1..n – this means that if the total\_number\_transactions = 3 which was passed in then there should be a status, response, reference\_number, credit\_amount, and error associated with each credit attempted. Each field would end in the number

example:

if total\_number\_transactions = 3 then in the response there would be a status1 , status2 and a status3 field.

### 3.3.5. Retail (Card Present) Single Transaction Credit Response

Returned from XMLGateway for operation\_type retail\_alone\_credit:

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="status">0-error 1-success 2-declined</FIELD>
<FIELD KEY="auth_response">message from the bank </FIELD>
<FIELD KEY="order_id">echoed back from original post</FIELD>
<FIELD KEY="reference_number">returned for use with credits/voids/settles</FIELD>
<FIELD KEY="error">error text</FIELD>
</FIELDS>
</RESPONSE>
```

### 3.3.6. ACH Credit Transaction Response

Returned from XMLGateway for operation\_type ach\_credit:

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="status">0-error 1-success 2-declined</FIELD>
<FIELD KEY="auth_response">message from the bank </FIELD>
<FIELD KEY="order_id">echoed back from original post</FIELD>
<FIELD KEY="reference_number">returned for use with credits/voids/settles</FIELD>
<FIELD KEY="error">error text</FIELD>
</FIELDS>
</RESPONSE>
```

## 3.4. Void Operations

VOID operations are performed against AUTH transactions that have not settled or ACH transactions that have not posted. Voids will prevent the authorized credit card or pending ACH transactions from ever

settling/posting. You cannot VOID a credit card settled or credited transaction nor can a posted ACH transaction be voided.

The <total\_number\_transactions> field specifies the **N** number of <reference\_number> tags to look for. They must match or it will error out.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"void" or "ach_void"	X
<b>Credit/Void/Settle Data Section</b>		
total_number_transactions	String	X
reference_number1...n	numeric	X
<b>Customer Ip Address Section</b>		
remote_ip_address	String	

### 3.4.1. E-commerce/MOTO/Retail (Card Present)/ACH Void Existing Transaction

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">void</FIELD>
<FIELD KEY="total_number_transactions">2</FIELD>
<FIELD KEY="reference_number1">1222</FIELD>
<FIELD KEY="reference_number2">33334</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.4.2. E-commerce/MOTO/Retail (Card Present)/ACH Void Existing Transaction Response

**Returned from XMLGateway for operation\_type void:**

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
<FIELD KEY="total_transactions_voided">Total number of transactions voided</FIELD>
<FIELD KEY="status1..n"> 0-error 1-success 2-rejected</FIELD>
<FIELD KEY="response1..n">Response text returned by Transaction Center</FIELD>
<FIELD KEY="reference_number1..n">reference number of credited transaction</FIELD>
<FIELD KEY="error1..n">error text</FIELD>
</FIELDS>
</RESPONSE>
```

**\*\*NOTE\*\***

total\_transactions\_voided - the number of successful voids performed on the list of voids attempted. This value can be used to check the successful statuses of the voids attempted.

### 3.5. *Settle Operations*

SETTLE operations allow the merchant to submit the reference numbers of corresponding authorized transactions for batch settlement. The settlement occurs between 2:00 AM and 6:00 AM each day. All AUTH transactions must be followed with a corresponding SETTLE operation against their reference number in order for the merchant to receive the funds for the transaction.

The <total\_number\_transactions> field specifies the **N** number of <reference\_number> and <settle\_amount> tags to look for. They must match or it will error out.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"credit"	X
<b>Credit/Settle Data Section</b>		
total_number_transactions	String	X
reference_number1...n	numeric	X
settle_amount1...n	Money	X
<b>Customer IP Address Section</b>		
remote_ip_address	String	

#### 3.5.1. E-commerce/MOTO/Retail (Card Present) Settle Existing Transactions

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">settle</FIELD>
<FIELD KEY="total_number_transactions">2</FIELD>
<FIELD KEY="reference_number1">1222</FIELD>
<FIELD KEY="reference_number2">33334</FIELD>
<FIELD KEY="settle_amount1">5.00</FIELD>
<FIELD KEY="settle_amount2">1.00</FIELD>
<FIELD KEY="remote_ip_address">127.0.0.1</FIELD>
</FIELDS>
</TRANSACTION>
```

#### 3.5.2. E-commerce/MOTO/Retail (Card Present) Settle Existing Transaction Response

**Returned from XMLGateway for operation\_type settle:**

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
  <FIELDS>
    <FIELD KEY="total_transactions_settled">Total number of transactions settled</FIELD>
    <FIELD KEY="total_amount_settled">amount that was successful set to settle pending</FIELD>
    <FIELD KEY="status1..n"> 0-error 1-success 2-rejected</FIELD>
    <FIELD KEY="response1..n">Response text returned by Transaction Center</FIELD>
    <FIELD KEY="reference_number1..n">reference number of credited transaction</FIELD>
    <FIELD KEY="settle_amount1..n">amount settled w/o $</FIELD>
    <FIELD KEY="batch_number1..n">Batch Number for corresponding transaction</FIELD>
    <FIELD KEY="error1..n">error text</FIELD>
  </FIELDS>
</RESPONSE>
```

**\*\*NOTE\*\***

total\_transactions\_settled - the number of successful settles performed on the list of settles attempted. This value can be used to check the successful statuses of the returned settles and make sure the number of successful statuses is the same as the total\_transactions\_settled.

total\_amount\_settled – the total value of the transactions marked for settle pending which, if all approved will be deposited into your account.

1..n – this means that if the total\_number\_transactions = 3 which was passed in then there should be a status, response, reference\_number, batch\_number, settle\_amount, and error associated with each settle attempted. Each field would end in the number

ex:

if total\_number\_transactions = 3 then in the response there would be a status1 , status2 and a status3 field..

### 3.6. Query Operations

QUERY operations allow the merchant to query the transaction database for all transaction types over a specified query range. The merchant may query any combination of ACH and or Credit Card transaction data. The transaction data is returned with reference numbers. Reference numbers are required to be passed into the gateway in order to process further operations against each transaction. NOTE – the full card number or ACH DDA (direct deposit account) number will not be exposed in a query transaction as per PCI requirements.

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
operation_type	"query"	X
<b>Query Data Section</b>		
card_type	String	
trans_type	Set group	
trans_status	Boolean	
begin_date	String	X
end_date	String	X

<b>low_amount</b>	Money	
<b>high_amount</b>	Money	
<b>order_id</b>	String	
<b>card_number</b>	numeric	

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
  <FIELDS>
    <FIELD KEY="transaction_center_id">1264</FIELD>
    <FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
    <FIELD KEY="operation_type">query</FIELD>
    <FIELD KEY="card_type"> </FIELD>
    <FIELD KEY="trans_type">SALE</FIELD>
    <FIELD KEY="trans_status">1</FIELD>
    <FIELD KEY="begin_date">120108</FIELD>
    <FIELD KEY="begin_time"> </FIELD>
    <FIELD KEY="end_date"> </FIELD>
    <FIELD KEY="end_time"> </FIELD>
    <FIELD KEY="order_id">test txn</FIELD>
    <FIELD KEY="card_number"></FIELD>
    <FIELD KEY="low_amount">1.00</FIELD>
    <FIELD KEY="high_amount">500.00</FIELD>
  </FIELDS>
</TRANSACTION>
```

**\*\*NOTE\*\***

**for any of the not required fields if you leave them blank they query will search for all possible options and ignore the blank fields.**

**Returned from XMLGateway for operation\_type query:**

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
  <FIELDS>
    <FIELD KEY="records_found">total number of records returned </FIELD>
    <FIELD KEY="status"> 0-error 1-success 2-rejected</FIELD>
    <FIELD KEY="trans_type1..n">type of trans </FIELD>
    <FIELD KEY="trans_status1..n">status</FIELD>
    <FIELD KEY="settled1..n">1 (yes) or 0 (no)</FIELD>
    <FIELD KEY="credit_void1..n"> None, Full Credit, Partial Credit, Void </FIELD>
    <FIELD KEY="order_id1..n">unique id </FIELD>
    <FIELD KEY="reference_number1..n">unique id </FIELD>
    <FIELD KEY="trans_time1..n">MM/DD/YYYY HH:MM:SS AM/PM</FIELD>
    <FIELD KEY="card_type1..n">( Visa, Amex, Discover or MasterCard) </FIELD>
    <FIELD KEY="amount1..n">auth or sale amount with no $</FIELD>
    <FIELD KEY="amount_settled1..n">settled amount with no $</FIELD>
    <FIELD KEY="amount_credited1..n">credited amount with no $</FIELD>
    <FIELD KEY="error1..n">error text</FIELD>
  </FIELDS>
</RESPONSE>
```

**\*\*NOTE\*\*** if records\_found is 0 then only error is returned no error1...n

### 3.7. *CIM Operations*

CIM operations are separate functions from the CIM authorization and sale warranting its own section in the documentation. The operations available under the API for CIM are CIM\_INSERT, CIM\_EDIT and CIM\_DELETE.

CIM\_INSERT allows the creation of a CIM account without first charging a customer. A CIM account can be created with Credit Card information and/or ACH information and Shipping information.

CIM\_EDIT allows the changing of any or all fields associated to a CIM records based on the CIIM reference number. An example requiring a CIM edit would be updating a credit card expiration date. Instead of issuing a brand new CIM Sale, a CIM\_EDIT can be performed by sending the new credit card expiration date in order to update the record and continue to be able to perform auth/sale operations.

CIM\_DELETE allows the permanent removal of a CIM record from the system. By sending a CIM\_DELETE command to the gateway, the record associated to the CIM reference number and all of its associated records will be removed from storage. NOTE – CIM\_DELETE cannot be undone. Once the command mis sent and a successful response is received, the record is removed permanently without the ability to restore.

#### 3.7.1. CIM INSERT Creating Customer

##### CIM Field Requirements Create Customer

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
Operation_type	"cim_insert"	X
<b>CIM Details Section</b>		
cim_ref_num	String	X
<b>Shipping Address Section</b>		
shipping_name	String	
shipping_street	String	
shipping_street2	String	
shipping_city	String	
shipping_state	String	
shipping_zip	String	
shipping_country	String	
shipping_phone	String	
shipping_email	String	
shipping_method	String	
<b>Credit Card Data Section</b>		
card_name	String	
card_number	Numeric	
card_exp	Numeric	
<b>ACH Data Section</b>		
aba	Numeric	

dda	Numeric	
ach_account_type	Char	
ach_name	String	
<b>Card Holder/ACH Owner Billing Address Section</b>		
owner_name	String	x
owner_street	String	x
owner_street2	String	
owner_city	String	x
owner_state	String	x
owner_zip	String	x
owner_country	String	x
owner_email	String	
owner_phone	String	

**Example: CIM INSERT**

```

<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_insert </FIELD>
<FIELD KEY="cim_ref_num">100231</FIELD>
<FIELD KEY="shipping_name">Bob Tester</FIELD>
<FIELD KEY="shipping_street">123 Test Rd.</FIELD>
<FIELD KEY="shipping_street2"></FIELD>

<FIELD KEY="owner_phone">555-555-5555</FIELD>
<FIELD KEY="aba">031200213</FIELD>
<FIELD KEY="dda">7596321546</FIELD>
<FIELD KEY="ach_account_type">C</FIELD>
<FIELD KEY="ach_name">Citibank </FIELD>
</FIELDS>
</TRANSACTION>

```

### 3.7.2. CIM INSERT Transaction Response

Returned from XMLGateway for operation\_type cim\_insert:

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
  <FIELDS>
    <FIELD KEY="status"> 0-error 1-success 2-Rejected</FIELD>
    <FIELD KEY="cim_ref_num">cim reference number</FIELD>
    <FIELD KEY="error">error text</FIELD>
  </FIELDS>
</RESPONSE>
```

### 3.7.3. CIM EDIT Existing Customer

CIM Field Requirements Edit Existing Customer

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
transaction_center_id	Number	X
gateway_id	Unique identifier	X
Operation_type	"cim_edit"	X
<b>CIM Details Section</b>		
cim_ref_num	String	X
<b>Shipping Address Section</b>		
shipping_name	String	
shipping_street	String	
shipping_street2	String	
shipping_city	String	
shipping_state	String	
shipping_zip	String	
shipping_country	String	
shipping_phone	String	
shipping_email	String	
shipping_method	String	
<b>Credit Card Data Section</b>		
card_name	String	
card_number	Numeric	
mag_data	String	
card_exp	Numeric	
cvv2	Numeric	
card_sequence	Int	
<b>ACH Data Section</b>		
aba	Numeric	
dda	Numeric	
ach_account_type	Char	
ach_sequence	Int	
<b>Card Holder/ACH Owner Billing Address Section</b>		
owner_name	String	
owner_street	String	
owner_street2	String	

<b>owner_city</b>	String	
<b>owner_state</b>	String	
<b>owner_zip</b>	String	
<b>owner_country</b>	String	
<b>owner_email</b>	String	
<b>owner_phone</b>	String	

**Example: CIM EDIT (Card Expiration and Card Holder Address)**

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_edit </FIELD>
<FIELD KEY="card_exp">1018</FIELD>
<FIELD KEY="owner_street">789 New CIM Rd.</FIELD>
<FIELD KEY="owner_city">New CIM City</FIELD>
<FIELD KEY="cim_ref_num">100231</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.7.4. CIM DELETE Existing Customer

**CIM Field Requirements Edit Existing Customer**

Field Name	Field Value	Required
<b>Transaction Header Section</b>		
<b>transaction_center_id</b>	Number	X
<b>gateway_id</b>	Unique identifier	X
<b>Operation_type</b>	"cim_delete"	X
<b>CIM Details Section</b>		
<b>cim_ref_num</b>	String	X

**Example: CIM DELETE Existing Customer**

```
<?xml version="1.0" encoding="UTF-8"?>
<TRANSACTION>
<FIELDS>
<FIELD KEY="transaction_center_id">1264</FIELD>
<FIELD KEY="gateway_id">a91c38c3-7d7f-4d29-acc7-927b4dca0dbe</FIELD>
<FIELD KEY="operation_type">cim_delete</FIELD>
<FIELD KEY="cim_ref_num">100231</FIELD>
</FIELDS>
</TRANSACTION>
```

### 3.7.5. CIM EDIT/DELETE Transaction Response

**Returned from XMLGateway for operation\_type cim\_edit/cim\_delete:**

```
<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
<FIELDS>
```

```

    <FIELD KEY="status"> 0-error 1-success 2-Rejected</FIELD>
    <FIELD KEY="error">error text</FIELD>
  </FIELDS>
</RESPONSE>

```

## 4. XML Error Responses

Malformed fields or bad xml in all cases will be returned in the xml response defined for the operation type sent in with the error field defined. For operation types that cannot be induced from incoming fields a generic xml response will come back with simply an error field defined with the reason for the failure.

As is commonplace in XML, fields with no values can be self closing, if no error is returned in the error field, then it will return as <FIELD KEY="error" />. Please note that some successful transactions will return the error field empty with the self closing syntax.

### STATUS – 0:

```

<FIELD KEY="status">0</FIELD>
<FIELD KEY="auth_code"></FIELD>
<FIELD KEY="auth_response"></FIELD>
<FIELD KEY="avs_code"></FIELD>
<FIELD KEY="cvv2_code"></FIELD>
<FIELD KEY="order_id">'WHATEVER WAS SENT IN</FIELD>
<FIELD KEY="reference_number"></FIELD>
<FIELD KEY="error">DESCRIPTIVE ERROR MESSAGE</FIELD>

```

Notice most fields are blank when status = 0! If the status is a 1 or 2 then the fields will be filled in with the appropriate responses

### error –

As is commonplace in XML, fields with no values can be self closing, if no error is returned in the error field, then it will return as <FIELD KEY="error" />. Please note that some successful transactions will return the error field empty with the self closing syntax.

If status is 1 the response will look like this:

```

<FIELD KEY="status">1</FIELD>
<FIELD KEY="auth_code">AB5943</FIELD>
<FIELD KEY="auth_response">Approved</FIELD>
<FIELD KEY="avs_code">Y</FIELD>
<FIELD KEY="cvv2_code">U</FIELD>
<FIELD KEY="order_id">Test Txn Oid</FIELD>
<FIELD KEY="reference_number">1549843</FIELD>
<FIELD KEY="error" />

```

**reference\_number** – this is the number used in later operations to reference specific transactions for credits, voids and settles.

### Generic Example Error:

```

<?xml version="1.0" encoding="UTF-8"?>
<RESPONSE>
  <FIELDS>
    <FIELD KEY="error">DESCRIPTIVE ERROR MESSAGE</FIELD>
  </FIELDS>
</RESPONSE>

```

</FIELDS>  
</RESPONSE>

## 5. Test Authorization Account Information

In order to test your implementation of the XML Gateway, you may supply test transaction data that will either produce an authorization or decline or error. By using the test data, you may ensure that you are properly communicating with the transaction gateway and also properly parsing the return values.

**To test a successful response from the gateway, please provide the values for the following variables:**

merchant = 1264  
password = password  
gateway\_id = a91c38c3-7d7f-4d29-acc7-927b4dca0dbe  
order\_id = any unique invoice number.

To get an approved response for Credit Card, use the following information:

Visa: 4111111111111111 CVV2 = 123  
Mastercard: 5000300020003003 CVC2 = 123  
Discover: 6011111111111117 CVV2 = 123  
Amex: 374255312721002 CVV2 = 1234

To get a pending response for ACH, use the following information:

aba (Routing Number): 123123123  
dda (Direct Deposit Account): 1234567890  
ach\_name: Any Bank  
ach\_category\_text : Web Payments  
ach\_account\_type: C  
close\_date: NOTE –please be sure to use a post date that is either the current date or in the future.

Test Address information:

Address: 123 Test St  
Zip: 12345-6789

The remaining field values you can make whatever you want to test all the various aspects of the API, just make sure to fulfill the defined criteria listed above for the different operation types.

\* As this is a generic test account, try to use a formula that will generate unique order\_id's based on your merchant name.

**To test a decline Credit Card response from the gateway, please provide the values for the following variables:**

Use above information and any other card number other than those listed above. Legitimate card numbers will decline since this is a test account.

The remaining field values you can make whatever you want to test all the various aspects of the API, just make sure to fulfill the defined criteria listed above for the different operation types.

**To test an error response from the gateway, please provide the values for the following variables:**

To generate an error, use the above account information and provide bad XML or bad data in the XML fields and an error response will be generated.

The remaining field values you can make whatever you want to test all the various aspects of the API, just make sure to fulfill the defined criteria listed above for the different operation types.

**NOTE – It is strongly recommended that all procedures be tested to ensure that your gateway integration is complete and correct.**

## 6. Sample Code

The sample code is provided as is. The sample provides an XML interface to each of the operation\_types in one process. This code can be cut out and saved on any windows platform with perl 5 installed and the XML::Simple and Win32::OLE modules installed. Only order\_id and reference fields need necessarily be changed. The sample uses the test gateway account.

}
}

```

## 6.1.2. Perl 5 Sample for E-commerce

Windows Perl 5.6 – Object Method

```

##### XMLgatewaytest.cgi #####
#
#This program is used to connect to the xml gateway api
#you will notice 6 variables named $xml_1 - $xml_6
#each variable contains the correctly formatted xml request required to send to the api
#for each of the 6 operation types that can be performed.
#Each request can be altered by you to test the api and validate the responses you receive
#back.
#
#You will also notice the two code snippets that handle sending the XML to the api
#and receiving the response back. Simply change which XML variable you want to
#either POST or GET to test the different operation types and responses
